

AI Full Stack Engineering Intern

Asian Institute of Digital Finance • National University of Singapore

Join AIDF at NUS to build and deploy commercial AI-powered financial products, spanning full stack applications and AI agents. Deliver for real users, with high standards for accuracy, reliability, and safety.

Explore [FinTutor](#), one of our AI research projects.

What you will do

- Build features across frontend interfaces, backend APIs, and databases; take them through testing, production deployment, and support after release.
- Build and tune AI agents, including prompts, tool use, and workflows; diagnose failures and improve task completion.
- Improve RAG, from document processing and retrieval to answers grounded in sources. Implement and test guardrails for unsafe requests, prompt injection, and tool permissions.
- Evaluate agents with realistic tests and failure analysis. Track answer accuracy, retrieval quality, task success, latency, and cost; check for regressions before release.
- Write maintainable code, use Git and code reviews, and troubleshoot production issues with logs and monitoring. Own agreed tasks and communicate blockers early.

What we look for

- Solid coding fundamentals and experience building a working application across frontend, backend, and database layers. Coursework and personal projects count.
- Hands-on ability to build, steer, and improve AI agents: select models, design prompts and tool workflows, and implement and tune RAG and guardrails. Diagnose failures and make AI systems consistently meet product requirements.
- Strong awareness of the latest AI models, tools, and techniques. Proactively experiment, understand their capabilities and limitations, and use rigorous evaluation to judge whether they improve accuracy, reliability, and task success.
- Learn quickly, stay curious, and think critically. Question assumptions and verify AI-generated code and claims. Understand what you ship and own its correctness.
- Follow through on commitments: debug patiently, protect data, and deliver reliable systems.

Open to postgraduate students in computing or related fields.

Prior full-time industry experience is a bonus!

What you will gain

- Mentorship from top AI and finance researchers; technical exchanges with senior engineers.
- Direct exposure to financial institution clients to understand real business challenges and develop practical AI solutions.
- Hands-on product delivery: design solutions, deploy to production, and improve products through client feedback.
- **Outstanding interns may receive a full-time return offer!**

How to apply

Send your CV, a project or GitHub link, and availability to Dr Yao Xuan at yaoxuan@nus.edu.sg. Briefly describe your own contribution and one engineering or AI quality problem you solved.
